

## Piecewise Defined Functions

The functions in the following four examples are defined by different formulas in different parts of their domains. Such functions are called **piecewise defined functions**.

### Example 7

A function  $f$  is defined by

$$f(x) = \begin{cases} 1 - x & \text{if } x \leq -1 \\ x^2 & \text{if } x > -1 \end{cases}$$

Evaluate  $f(-2)$ ,  $f(-1)$ , and  $f(0)$  and sketch the graph.

**Solution** Remember that a function is a rule. For this particular function the rule is the following: First look at the value of the input  $x$ . If it happens that  $x \leq -1$ , then the value of  $f(x)$  is  $1 - x$ . On the other hand, if  $x > -1$ , then the value of  $f(x)$  is  $x^2$ .

Since  $-2 \leq -1$ , we have  $f(-2) = 1 - (-2) = 3$ .

Since  $-1 \leq -1$ , we have  $f(-1) = 1 - (-1) = 2$ .

Since  $0 > -1$ , we have  $f(0) = 0^2 = 0$ .

How do we draw the graph of  $f$ ? We observe that if  $x \leq -1$ , then  $f(x) = 1 - x$ , so the part of the graph of  $f$  that lies to the left of the vertical line  $x = -1$  must coincide with the line  $y = 1 - x$ , which has slope  $-1$  and  $y$ -intercept  $1$ . If  $x > -1$ , then  $f(x) = x^2$ , so the part of the graph of  $f$  that lies to the right of the line  $x = -1$  must coincide with the graph of  $y = x^2$ , which is a parabola. This enables us to sketch the graph in Figure 15. The solid dot indicates that the point  $(-1, 2)$  is included on the graph; the open dot indicates that the point  $(-1, 1)$  is excluded from the graph.

**Figure 15**

The next example of a piecewise defined function is the absolute value function. Recall that the **absolute value** of a number  $a$ , denoted by  $|a|$ , is the distance from  $a$  to  $0$  on the real number line. Distances are always positive or  $0$ , so we have

$$|a| \geq 0 \quad \text{for every number } a$$

Note

For a more extensive review of absolute values, see [Appendix A](#).

For example,

$$|3| = 3 \quad |-3| = 3 \quad |0| = 0 \quad |\sqrt{2} - 1| = \sqrt{2} - 1 \quad |3 - \pi| = \pi - 3$$

In general, we have

$$|a| = a \quad \text{if } a \geq 0$$

$$|a| = -a \quad \text{if } a < 0$$

(Remember that if  $a$  is negative, then  $-a$  is positive.)

### Example 8

Sketch the graph of the absolute value function  $f(x) = |x|$ .

Solution From the preceding discussion we know that

$$|x| = \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0 \end{cases}$$

Using the same method as in [Example 7](#), we see that the graph of  $f$  coincides with the line  $y = x$  to the right of the  $y$ -axis and coincides with the line  $y = -x$  to the left of the  $y$ -axis (see [Figure 16](#)).

**Figure 16**

### Example 9

Find a formula for the function  $f$  graphed in [Figure 17](#).

**Figure 17**

Solution The line through  $(0, 0)$  and  $(1, 1)$  has slope  $m = 1$  and  $y$ -intercept  $b = 0$ , so its equation is  $y = x$ . Thus, for the part of the graph of  $f$  that joins  $(0, 0)$  to  $(1, 1)$ , we have

$$f(x) = x \quad \text{if } 0 \leq x \leq 1$$

The line through  $(1, 1)$  and  $(2, 0)$  has slope  $m = -1$ , so its point-slope form is

$$y - 0 = (-1)(x - 2)$$

or

$$y = 2 - x$$

So we have

$$f(x) = 2 - x \quad \text{if } 1 < x \leq 2$$

We also see that the graph of  $f$  coincides with the  $x$ -axis for  $x > 2$ . Putting this information together, we have the following three-piece formula for  $f$ :

$$f(x) = \begin{cases} x & \text{if } 0 \leq x \leq 1 \\ 2 - x & \text{if } 1 < x \leq 2 \\ 0 & \text{if } x > 2 \end{cases}$$

Note

Point-slope form of the equation of a line:

$$y - y_1 = m(x - x_1)$$

See [Appendix B](#).

### Example 10

In Example C at the beginning of this section we considered the cost  $C(w)$  of mailing a large envelope with weight  $w$ . In effect, this is a piecewise defined function because, from the table of values, we have

$$C(w) = \begin{cases} 0.98 & \text{if } 0 < w \leq 1 \\ 1.19 & \text{if } 1 < w \leq 2 \\ 1.40 & \text{if } 2 < w \leq 3 \\ 1.61 & \text{if } 3 < w \leq 4 \\ \vdots & \end{cases}$$

The graph is shown in [Figure 18](#). You can see why functions similar to this one are called **step functions**—they jump from one value to the next. Such functions will be studied in [Chapter 2](#).
